SLAC Cloud Services Hiring Team SLAC National Accelerator Laboratory 2575 Sand Hill Road, Menlo Park, CA 94025

Re: Cloud Infrastructure Engineer (Job ID 201130)

Dear Hiring Team,

I spent nearly four years as a DevOps engineer and security architect at Stanford, connecting distributed teams' cloud environments to central identity services across multi-account AWS and a growing GKE footprint. Your posting describes that same work, and I'd like to bring what I learned there, and what I've built since, to SLAC. I'm also planning to relocate to the Bay Area for this role.

Identity and hybrid integration. At Stanford I helped move the university's authentication stack (SAML/Shibboleth SSO, Kerberos v5, OpenLDAP) onto Kubernetes and managed multi-tenant Vault clusters for PKI. I also architected a zero-trust Active Directory whose domain controllers stay invisible until clients establish IPsec with ephemeral Vault certificates. Delivered over IPv6, it let any team's VPC join the domain without IP coordination or peering.

Reusable, automated platforms. I prefer code to hand-built resources. At ZagTech I created à la carte-as-code, a radically simple Terraform design for ordering complex Kubernetes clusters from a menu. At The Motley Fool I wrote Python tooling that migrated about 200 repositories from Jenkins to GitHub Actions.

Security and research workloads. I co-founded a consultancy that builds Terraform-based Zero Trust capability packages modeled on NIST SP 800-207, and I've supported research computing from petabyte-scale genomics at Invitae to high-performance fleets at Two Sigma.

I share your priority of keeping operational knowledge in-house, and I document what I build so others can own it. I'd welcome the chance to discuss how I can help grow SLAC's cloud platforms.

Sincerely,

Ian Douglas
