Dear Hiring Team,

I'm a platform and security engineer with 15+ years of building secure, code-driven infrastructure on Kubernetes, AWS, Azure, and GCP. I design the architecture, write the code, and run what I build in production.

At Pearson I operated and extended Bitesize, a self-managed Kubernetes platform on AWS used by about 400 development teams. I wrote 30+ Terraform modules for it and shipped daily platform releases. At ZagTech I engineered a Kubernetes platform on Azure (AKS); the firm's largest client adopted it immediately in a $250K engagement.

Identity and security run through my work. At Stanford I modernized OpenLDAP on Kubernetes, and it ran as the directory for the entire university. I also designed and deployed Active Directory over IPv6 with certificate-authenticated IPsec. Today I co-run a consultancy that builds Terraform-based Zero Trust controls modeled on NIST SP 800-207.

Most recently, at The Motley Fool, I used Claude Code to build Python tooling that migrated about 200 repositories from Jenkins to GitHub Actions.

I'd welcome a conversation about how I can help your team. My resume and work samples are at github.com/iancaseydouglas/resume.

Sincerely,

Ian Douglas
