Dear Hiring Team,

I'm a platform architect with 12+ years delivering infrastructure-as-product, automation tooling, and self-service platforms across AWS, Azure, and GCP. I specialize in Kubernetes, zero-trust architecture, and identity infrastructure, and I'd like to bring that experience to your team. A few highlights:

- **Automation Tooling:** At The Motley Fool, I built reusable Python tooling, developed with Claude Code, that migrated ~200 repositories from Jenkins to GitHub Actions and saved months of manual effort. I genuinely enjoy writing code and have worked in Python since 2012 and in Go for years.
- **Kubernetes & Platforms:** I've built and operated Kubernetes platforms at Stanford, Pearson, Invitae, and ZagTech, where the platform I engineered was commercialized across enterprise clients and became a primary value driver in the firm's acquisition.
- **Security & Identity:** From Vault PKI and identity modernization at Stanford to zero-trust compliance automation at Kings Mountain Security, I treat security as part of the platform, not an add-on.
- **Operations at Scale:** I built database automation and co-developed cluster operations tools for Marvel Heroes, cutting service drain times by 93% for 40k+ daily active users.

You'll find detailed examples of my work in my portfolio at github.com/iancaseydouglas/resume.

I'd welcome the chance to discuss how I can contribute to your team.

Sincerely,

Ian Douglas
